CHEMICAL-MECHANICAL PLANARIZATION OF BARRIERS OR LINERS FOR COPPER METALLURGY

Abstract of the Disclosure

A tantalum-based liner for copper metallurgy is selectively removed by chemical-mechanical planarization (CMP) in an acidic slurry of an oxidizer such as hydrogen, žeroxide, deionized water, a corrosion inhibitor such as BTA, and a surfactant such as Duponol SP, resulting in a high removal rate of the liner without appreciable removal of the exposed copper and with minimal dishing.
